

# Smoke Diversion Pecan Eco

After firing up, with the air valve and the flue valve open, the Pecan Eco needs 30 minutes to reach the right temperature.

≈ 350 °C

After 30 minutes, the flue valve (A) can be closed completely and the air valve (B) can be closed a little bit, depending on the amount of wood.

Note: Make sure the flue valve (A) is **opened** when you open the door for refilling.

The flue gases will then be directed through a special ducting along the soapstone, enhancing the stove's heat storage and efficiency

≈ 190 °C
